Summary

Systems software engineer with four years of hands-on experience in Rust, C, Typescript, and Python. I focus on high-performance, low-level software: manual memory management, multi-threading, networking, and operating system internals.

I build Rust libraries for low-level networking. My project rat is a packet-capture and protocol-parsing library built around a custom procedural macro, `#[packet]`. From one annotated struct, the macro generates zero-copy types, plus the metadata that links each protocol to its layer, its parent, and its next protocol. Protocols are registered through a builder-style `ProtocolRegistry`, which includes built-in defaults and supports user-defined custom protocols. A capture thread sends batches of raw packets to a pool of worker threads over a channel, and labeled fields make packets and layers easy to inspect and debug.

I'm looking for a systems role in low-level software or real-time data processing. I'm based in Tbilisi, Georgia, and open to relocating to Germany.

Experience

Data Engineer (Contract), Coca-Cola

Dec 2025 - Mar 2026

- Built datasets and data engineering workflows for training machine learning models.
- Managed a dataset of 250k+ images, preparing it for model training.
- Set up a Label Studio labeling dashboard with a custom interface and an ML backend that pre-labels data, making labeling faster.

Systems Engineer, Octarinox

Feb 2023 - Aug 2025

- Built infrastructure for a real-time video processing system running on NVIDIA Jetson Nano.
- Implemented multi-object tracking with ByteTrack and optimized the pipeline for high throughput on limited edge hardware.

Junior Backend Developer, Arena Sports Complex

Oct 2022 - Dec 2022

- Built a customer management system with Nest.js.
- Implemented role-based access control so that different staff roles could access only the features they needed.

Skills

Languages

Rust, C, TypeScript, Python, SQL

Systems

multithreading and concurrency, networking and packet capture, memory management, operating system internals, Linux

Edge & ML tooling

NVIDIA Jetson, YOLO, Label Studio, dataset preparation and labeling pipelines

Backend & infrastructure

Docker, Nginx, NestJS, REST APIs
